1. Which of the following statements correctly describe strings? Select all that apply.

1 / 1 point

☒ Strings must be placed in quotation marks (" ").☒ Correct

Strings must be placed in quotation marks. Strings are also immutable. This means they cannot be changed after they are created and assigned a value.

☐ Strings must be placed in brackets ([]).☐ Strings cannot contain numeric characters.☒ Strings are immutable.☒ Correct

Strings must be placed in quotation marks. Strings are also immutable. This means they cannot be changed after they are created and assigned a value.

2. What does the following code return?

1 / 1 point

```
device_id = "uu0ktt0vwugjyf2"
```

```
print(device_id[2:5])
```

☐ "u0k"☐ "0ktt"☐ "u0kt"☒ "0kt"☒ CorrectThis code returns "0kt". It uses bracket notation to take a slice of the value contained in the `device_id` variable. Indices start at 0 in Python. It extracts the characters at indices 2, 3, and 4. The character at index 5 is excluded from the slice.

3. What does the following code display?

1 / 1 point

```
device_id = "Tj1C58Dakx"
```

```
print(device_id.lower())
```

☐ "tj1C58Dakx"☐ "Tj1C58DAKX"☒ "tj1c58dakx"☐ "Tj1C58Dakx"This code displays "tj1c58dakx". The `.lower()` method converts all uppercase characters into lowercase characters.4. You want to find the index where the substring "192.168.243.140" starts within the string contained in the variable `ip_addresses`. Complete the Python code to find and display the starting index. (If you want to undo your changes to the code, you can click the Reset button.)

1 / 1 point

```
1 ip_addresses = "192.168.140.81, 192.168.109.50, 192.168.243.140"
2 ###YOUR CODE HERE###
```

[Run](#)[Reset](#)

What index does the substring "192.168.243.140" start at?

☐ 34☐ 31☐ 33☒ 32☒ CorrectThe substring "192.168.243.140" starts at index 32. You can determine this using the code `ip_addresses.index("192.168.243.140")`. Note that Python indices start at 0.
