Malware prevention

Communication

As an analyst prevents and encounters threats, risks, or vulnerabilities, they document and **report findings**. A report might detail attempts to secure systems, test weak points, or offer solutions for system improvement. When reporting findings, strong **communication** skills are important.

Using SIEM tools

When security analysts need to review vulnerabilities, they conduct a **periodic security audit**. This is a review of an organization's records, activities, and related documents. During audits, **Security Information and Event Management (SIEM) tools** help analysts better understand security threats, risks, and vulnerabilities.
