

Your grade: 100%Your latest: **100%** • Your highest: **100%** • To pass you need at least 75%. We keep your highest score.[Next item →](#)

1. What type of information is contained within the header of an IP packet?

1 / 1 point

- ☒ The sender's IP address, the destination's MAC address, and the protocol to use
- ☐ An explanation of how the port number will be processed by the receiving device
- ☐ The message that needs to be transmitted to the receiving device
- ☐ A string of data indicating that the data transmission is complete

Correct

The sender's IP address, the destination's MAC address, and the protocol to use.

2. What characteristics do the TCP/IP and OSI models share? Select all that apply.

1 / 1 point

- ☒ Both models define standards for networking and divide the network communication process into different layers.

Correct

Both the TCP/IP and OSI models define standards for networking and divide the network communication process into different layers.

- ☒ Both models include an application and a transport layer.

Correct

Both the TCP/IP and OSI models include an application and a transport layer.

- ☒ Both models illustrate network processes and protocols for data transmission between two or more systems.

Correct

Both the TCP/IP and OSI models illustrate network processes and protocols for data transmission between two or more systems.

- ☐ Both models have 7 layers.

3. What is the Transmission Control Protocol (TCP)?

1 / 1 point

- ☐ Guidelines for proper network operations
- ☒ An internet communication convention
- ☐ A unique address that every device on a network is assigned
- ☐ A software application that organizes data

Correct

The TCP is an internet communication convention, or protocol. It allows two devices to form a

Correct

The TCP is an internet communication convention, or protocol. It allows two devices to form a connection and stream data.

4. Fill in the blank: A _____ is a software-based location that organizes the sending and receiving of data between devices on a network.

1 / 1 point

- ☐ channel
- ☐ segment
- ☒ port
- ☐ packet

Correct

A port is a software-based location that organizes the sending and receiving of data between devices on a network.

5. Which layer of the TCP/IP model has protocols that organize file transfers and email services?

1 / 1 point

- ☐ Transport layer
- ☐ Internet layer

☐ segment

☒ port

☐ packet

✓ Correct

A port is a software-based location that organizes the sending and receiving of data between devices on a network.

5. Which layer of the TCP/IP model has protocols that organize file transfers and email services?

1 / 1 point

☐ Transport layer

☐ Internet layer

☒ Application layer

☐ Network access layer

✓ Correct

The application layer has protocols that organize file transfers and email services. It does this by determining how data packets will interact with receiving devices. The application layer is the fourth layer in the TCP/IP model.
