

Reflect

Update: The NIST Cybersecurity Framework is a voluntary framework that consists of standards, guidelines, and best practices to manage cybersecurity risk. In the latest version, CSF v2.0, a new 'Govern' function has been added, emphasizing the importance of strong cybersecurity governance. This framework is widely respected and essential for maintaining security regardless of the organization you work for.

The CSF now consists of **six** important core functions: **Govern**, **Identify**, **Protect**, **Detect**, **Respond**, and **Recover**, which we'll discuss in detail in a future video.

CSF v2.0 also places greater emphasis on supply chain risk management.
