1. Playbooks are permanent, best-practice documents, so a security team should not make changes to them.

1 / 1 point

- ☐ True
☒ False

✓ **Correct**

Playbooks are living documents, so a security team will make frequent changes, updates, and improvements to address new threats and vulnerabilities.

2. A business recently experienced a security breach. Security professionals are currently restoring the affected data using a clean backup that was created before the incident. What playbook phase does this scenario describe?

1 / 1 point

- ☐ Detection and analysis
☒ Eradication and recovery
☐ Post-incident activity
☐ Containment

✓ **Correct**

This scenario describes eradication and recovery. This phase involves removing the incident's artifacts and restoring the affected environment to a secure state.

3. Fill in the blank: Once a security incident is resolved, security analysts perform various post-incident activities and _____ efforts with the security team.

1 / 1 point

- ☒ coordination
☐ preparation
☐ detection
☐ eradication

✓ **Correct**

Once a security incident is resolved, security analysts perform various post-incident activities and coordination efforts with the security team. Coordination involves reporting incidents and sharing information based on established standards.

4. Which action can a security analyst take when they are assessing a SIEM alert?

1 / 1 point

- ☒ Analyze log data and related metrics

- ☐ detection
☐ eradication

✓ **Correct**

Once a security incident is resolved, security analysts perform various post-incident activities and coordination efforts with the security team. Coordination involves reporting incidents and sharing information based on established standards.

4. Which action can a security analyst take when they are assessing a SIEM alert?

1 / 1 point

- ☒ Analyze log data and related metrics
☐ Isolate an infected network system
☐ Restore the affected data with a clean backup
☐ Create a final report

✓ **Correct**

An action that a security analyst can take when they are assessing a SIEM alert is to analyze log data and related metrics. This helps in identifying why the alert was generated by the SIEM tool and determining if the alert is valid.
