1. Consider the following scenario:

1 / 1 point

A company's cloud server has a misconfigured firewall that allows unrestricted access to its internal network.

This misconfiguration is an example of what?

- ☒ A vulnerability
- ☐ A security threat
- ☐ A security exploit
- ☐ An attack vector

✔ Correct

2. Fill in the blank: The five layers of the defense in depth model are: perimeter, network, endpoint, application, and _____.

1 / 1 point

- ☐ physical
- ☒ data

- ☐ session
- ☐ transport

✔ Correct

3. What is the difference between the application and data layers of the defense in depth model?

1 point

- ☐ The application layer maintains the integrity of information with controls like encryption and hashing. The data layer blocks network traffic from untrusted websites.
- ☐ The application layer secures information with controls that are programmed into the application itself. The data layer maintains the integrity of information with controls like encryption and hashing.
- ☐ The data layer only allows employees to access information. The application layer secures information with controls that are programmed into the application itself.
- ☒ The data layer includes controls like encryption and hashing to secure data at rest. The application layer protects individual devices that are connected to a network.

✘ Incorrect

Please review [the video about the controls used in defense in depth](#).

4. Which of the following are criteria that a vulnerability must meet to qualify for a CVE® ID? Select all that apply.

0.4 / 1 point

☒ It must pose a financial risk.

✘ This should not be selected

Please review [the video about common vulnerabilities and exposures](#).☒ It must be recognized as a potential security risk.

✔ Correct

☐ It can only affect one codebase.☒ It must be submitted with supporting evidence.

✔ Correct

☐ It must be independent of other issues.

5. Which of the following are characteristics of the vulnerability management process? Select two answers.

1 / 1 point

- ☐ Vulnerability management is a way to discover new assets.
- ☒ Vulnerability management should consider various perspectives.

✔ Correct

☐ Vulnerability management should be a one-time process.

- ☒ Vulnerability management is a way to limit security risks.

✓ Correct

6. During a vulnerability assessment, a scanner identifies a vulnerable onsite server. After analyzing the server, you discover that its operating system is missing critical updates.

1 / 1 point

What is the next step you should take in the vulnerability assessment process?

- ☐ Deactivate the server because its operating system is outdated.
- ☒ Perform a risk assessment of the old operating system.
- ☐ Scan the millions of devices that connect to the server.
- ☐ Disregard the outdated operating system because the device is operational.

✓ Correct

7. Which of the following are types of attack surfaces? Select three answers.

1 / 1 point

- ☐ Malicious software
- ☒ Computer workstations

✓ Correct

- ☒ Cloud servers

✓ Correct

- ☒ Network routers

✓ Correct

8. Fill in the blank: An attack _____ refers to the pathways attackers use to penetrate security defenses.

1 / 1 point

- ☒ vector
- ☐ surface
- ☐ vulnerability
- ☐ landscape

✓ Correct

9. Which of the following are reasons that security teams practice an attacker mindset? Select three answers.

1 / 1 point

- ☒ To find insights into the best security controls to use

✓ Correct

- ☒ To uncover vulnerabilities that should be monitored

✓ Correct

- ☒ To identify attack vectors

✓ Correct

- ☐ To exploit flaws in an application's codebase

10. What are ways to protect an organization from common attack vectors? Select three answers.

1 / 1 point

- ☒ By educating employees about security vulnerabilities

✓ Correct

- ☒ By keeping software and systems updated

✓ Correct

- ☒ By implementing effective password policies

☒ To identify attack vectors Correct☐ To exploit flaws in an application's codebase

10. What are ways to protect an organization from common attack vectors? Select three answers.

1 / 1 point

☒ By educating employees about security vulnerabilities Correct☒ By keeping software and systems updated Correct☒ By implementing effective password policies Correct☐ By not practicing an attacker mindset
