1. In a cybersecurity setting, which of these tasks would it be common to apply Python to? Select all that apply.

1 / 1 point

☒ Automating how a log is read when responding to an incident☒ Correct☒ Automating several tasks from a playbook into one workstream☒ Correct☒ Reducing the effort needed to manage an access control list☒ Correct☐ Manually checking individual timestamps in a log

2. What is wrong with the following code?

1 / 1 point

```
for username in failed_login:
```

```
print(username)
```

☒ The line with `print(username)` is not indented.☐ Both lines are not indented.☐ The line with `for username in failed_login:` is not indented.☐ The first line should be split in two, and `in failed_login:` should be indented on the new line.☒ Correct

3. Fill in the blank: String data ____.

1 / 1 point

☐ must include a decimal point☒ must be placed in quotation marks☐ must be placed in brackets☐ must be placed in parentheses☒ Correct4. Which data type always has a value of either **True** or **False**?

1 / 1 point

☐ String☐ Float☒ Boolean☐ List☒ Correct5. How do you assign the string value `"rtp3426"` to a variable called `device_id`?

1 / 1 point

☒ `device_id = "rtp3426"`☐ `device_id = rtp3426`☐ `device_id("rtp3426")`☐ `device_id(rtp3426)`☒ Correct

6. Fill in the blank: If you ran the following code, the output would ____.

1 / 1 point

```
var1 = 9.5
```

```
var1_type = type(var1)
```

```
print(var1_type)
```

- ☒ indicate that `var1` contains float data
- ☐ reassign `var1` as string data
- ☐ output `9.5` to the screen
- ☐ reassign `var1` as float data

✓ Correct

7. You are implementing security measures on a server. If a user has more than 3 failed login attempts, the program should print "locked out". The number of failed login attempts is stored in a variable called `failed_attempts`. Which conditional statement has the correct syntax needed to do this?

1 / 1 point

- ☐

```
if failed_attempts < 3
```

```
print("locked out")
```
- ☒

```
if failed_attempts > 3:
```

```
print("locked out")
```
- ☐

```
if failed_attempts >= 3
```

```
print("locked out")
```

- ☐

```
if failed_attempts <= 3:
```

```
print("locked out")
```

✓ Correct

8. You have written the following code:

1 / 1 point

```
if operating_system == "OS 3":
```

```
print("Updates needed")
```

You want to add to it so that it will print a "No updates needed" message whenever the value of `operating_system` is not "OS 3". Which lines of code have the correct syntax to do this?

- ☒

```
else:
```

```
print("No updates needed")
```
- ☐

```
else
```

```
print("No updates needed")
```
- ☐

```
elif operating_system == "OS 3":
```

```
print("No updates needed")
```

- ☐

```
else operating_system != "OS 3":
```

```
print("No updates needed")
```

✓ Correct

9. What will this iterative statement do?

1 / 1 point

```
for i in [0, 5]:
```

```
print(i)
```

- ☐ Output the integers 0, 1, 2, 3, and 4
- ☒ Output the integers 0 and 5
- ☐ Output the integer 0
- ☐ Output the integers 1 and 6

✓ Correct

10. How many times will the following code print the "warning" message?

1 / 1 point

```
count = 1
```

☐ Output the integers 1 and 6

 Correct

10. How many times will the following code print the "warning" message?

1 / 1 point

```
count = 1
while count < 5:
    print("warning")
    count = count + 1
```

- ☐ 0
- ☒ 4
- ☐ 5
- ☐ 1

 Correct
